

# Image Colorization

Figure 1: Examples of old photograph colorization[1].

Isn't it cool to turn an old photo into a colorful one? We aim to solve this problem in this project. Given a gray photograph as input, hallucinating its color version is an ill-posed problem. There are generally two approaches to tackle this problem: (1) user-guided; (2) data-driven.

One of the most famous **user-guided image** colorization work is *Colorization Using Optimization* [2]. Users only annotate an image with a few color scribbles, the colors are automatically propagated in space to produce a fully colorized image. Examples can be found on <http://www.cs.huji.ac.il/~yweiss/Colorization/>.

**Data-driven methods** depend heavily on the color priors in training dataset. Some recent work tried to solve this problem end-to-end using **convolutional neural networks** [1, 3].

Dataset for colorization is not a big issue, as RGB-Gray image pairs are easily accessible. Evaluations can be done by a "turing test": asking human participants to choose between a generated and ground truth color image.
